[alla.levitskaia@gmail.com](mailto:alla.levitskaia@gmail.com)

**Abstract.** In this study, the authors set the goal of the study - to analyze the features of IT project management in mobile marketing, to systematize the development models of modern web projects and to study the possibilities of using flexible applied methodologies that formalize the development and modification of web applications based on the use of effective methods for managing IT projects in mobile marketing. A comparative analysis of the feature's applicability of IT project management methodologies and problems of their using in mobile marketing applications are presented. The logical and structural diagram of the stages of the Mobile App Design Timeline is proposed, which contributes to increasing the effectiveness of the implementation of information technology projects in general.

**Keywords:** mobile marketing, mobile marketing IT project, flexible IT project management methodologies, MVP –minimum viable product.

**Rezumat.** În acest studiu, autorii au stabilit obiectivul studiului – să analizeze caracteristicile managementului proiectelor IT în marketingul mobil, să sistematizeze modelele de dezvoltare ale proiectelor web moderne și să studieze posibilitățile de utilizare a metodologiilor aplicate flexibile care să formalizeze dezvoltarea și modificarea de aplicații web bazate pe utilizarea unor metode eficiente pentru gestionarea proiectelor IT în marketingul mobil. Este prezentată analiza comparativă a metodologiilor de gestionare a proiectelor IT și a constrângerilor de utilizare a acestora în aplicațiile de marketing mobil. Se propune diagrama logică și structurală a etapelor Programului de proiectare a aplicațiilor mobile, care contribuie la creșterea eficacității implementării proiectelor de tehnologii informaționale în general.

**Cuvinte-cheie:** marketing mobil, marketing IT proiect IT, metodologii flexibile de gestionare a proiectelor IT, MVP – produs viabil minim.

В данном исследовании авторами поставлена цель исследования – проанализировать особенности управления ИТ-проектами мобильного маркетинга, систематизировать модели развития современных веб-проектов и изучить возможности использования гибких прикладных методологий, формализующих процессы разработки и модификации веб-приложений на основе применения эффективных методов управления ИТ-проектами мобильного маркетинга. Для достижения этой цели исследования авторы использовали теоретический и концептуальный анализ, изучили существующие

эмпирические базы данных рынка мобильных приложений в Республике Молдова и Украины. Авторами были выделены критические проблемы использования гибких методологий в ИТ-проектах мобильного маркетинга. Проведенный сравнительный анализ применимости данной методологии управления ИТ-проектами и проблем их использования в приложениях для мобильного маркетинга, позволил авторам предложить логическую структурную схему этапов разработки мобильных приложений, применение которой способствует повышению эффективности реализации проектов в сфере информационных технологий в целом.

**Ключевые слова:** мобильный маркетинг, мобильный маркетинг, ИТ-проект, гибкие методологии управления ИТ-проектами, MVP – минимально жизнеспособный продукт.

## INTRODUCTION

**Statement of the problem in general form and it's connection with important scientific or practical tasks.** The use of certain marketing concepts in enterprises is mainly due to the characteristics and trends of the market. In the process of market transformation, the marketing approach to it is changing. One of the global modern trends in digital marketing is the steady growth of mobile traffic, which is associated with both an increase in the number of mobile users, mobile Internet connections, mobile communications, and an increase in the speed of data transmission on mobile networks.

The average annual growth rate of mobile traffic over the next five years will be 60-70%. Mobile devices will generate more than 90 percent of traffic in 2020. In 2019, over two-thirds of Ukrainians and Moldovans are connected to the Internet, most of them using mobile devices to access the Internet (Douglas 2019). Today, mobile marketing is the preferred method of digital marketing – a set of promotions, events and campaigns carried out via mobile devices via SMS (Short Message Service) to promote goods and services (Danilenko 2014:174).

With the transition to the mobile marketing model, the processes of adapting and modifying the new functionality of web applications are accelerated, which requires the use of effective and adequate technologies for managing mobile marketing IT projects (creation of web applications for use with mobile devices). Reducing the timing of such projects, increasing the requirements of usability and the need for dynamic improvement of the quality assurance functionality requires formalizing the processes of web application development and modification based on the application of effective methods of managing mobile marketing IT projects.

## SCIENTIFIC APPROACH AND LITERATURE REVIEW

The classic definition of the American Marketing Association: "Marketing - function of the organization, which includes a set of processes for creating, promoting and the supply of consumer values through the management of customer relations, as a result of which the organization bears risks and benefits". Research on digital transformation of marketing; places of digital marketing in modern conditions of social development; features of digital marketing as a modern tool of communication management with consumers; components and tools of digital marketing are dedicated to the work of many domestic and foreign scientists: Oklander M. (2017), Oklander T., Yashkina O., Pedko I. (2018), Danilenko M. (2014), Gritsenko S. (2017), Ruban V. (2017), Shafalyuk O. (2017), Kwilinski A., Trushkina N. (2017), Kotler F. (2018), Kaplan A. (2012), Jeffrey M. (2018), Lengard I. (2017).

The analysis of the essence, prospects, methods, features and tendencies of the development of mobile marketing in the world and in Ukraine was carried out in the works of Mazurenko V.P., Matviienko N. (2011), Marchuk O. (2018), Romanenko O. (2015), Yatsyuk D. (2015). The issue of IT-project management at the theoretical level is considered in the works of Bourque P., Fairley R.E. (2014), Fattrell R., Donald Schafer F., Larman K., Cohn M., Cobb G. (2016), developed plenty of standard methodologies for process manufacturing software: ISO9001, ISO12207, ISO15504, CMM (Capability Maturity Model), MSF (Microsoft Solution Framework), RUP (Rational Unified

Process), SCRUM, XP (eXtremal Programming), Crystal Clear, ASD (Adaptive Software Development), Agile (2018:68).

The author Bhalla (2011) proved that the marketing strategy should focus on strengthening the interaction between seller and consumer. However, the researchers did not identify areas for monetization of the proposed solutions. The authors Iliashenco, Ivanova (2015) emphasized the importance of operational transactional interaction in real time. Systematized the main methods and tools of digital marketing, the specifics of their application. But digital marketing tools are rapidly being upgraded and the results of such research need to be developed. The research study of Oklander, Oklander, Yashkina (2018) contains an analysis of current trends in marketing research in the Internet environment.

Analysis of the literature on the comparison of technological innovations of digital marketing in terms of improving their effectiveness shows that, first, the research is fragmentary and does not show the system of their latest most effective tools, does not show their strengths and weaknesses. Secondly, although the issue of mobile marketing is being reprinted in research, not enough attention is paid to the strategies of its monetization. Third, in the presence of multivariate models of affiliate marketing development, their systematization and characteristics of each model are not proposed. Thus, to develop effective marketing strategies in the digital economy there is a need to improve the theoretical foundations of the use of innovative digital marketing tools, develop recommendations for effective strategies for their monetization and the formation of affiliate marketing models.

**Highlighting the previously unresolved parts of the general problem to which the article is devoted.** However, all attempts of formalization have failed, uniqueness of mobile marketing IT projects highlights the issue of choice of methods, practices and rules of lowering project risks.

**Formulation of the purpose of the article (statement of the problem).** The purpose of this study is to analyze the features of mobile marketing IT project management, systematize the development models of modern web projects, highlight critical problems of using flexible methodologies in mobile marketing IT projects, and develop recommendations for overcoming them.

## DATA SOURCES AND USED METHODS

Mobile applications are one of the most successful and promising marketing channels to date. According to Gartner, more than 10 billion mobile devices are registered in the world in 2019, including 1.7 billion machine-to-machine (M2M) connections. The number of mobile users has grown from 4.3 billion in 2012 to 5.3 billion in 2019. The current annual growth rate is 2.4%. The average mobile data rate has increased more than 7 times since 2012 (Gartner Special Report 2020).

The highest Internet speed in the world is in South Korea, 95.1 mbps, and within a year this figure grew by 120%. In 2019, this country was the first in the world to launch 5G high-speed Internet. In second place in speed – Qatar (69.1 mbps), in third – Norway (68 mbps). The average speed of mobile Internet in the world is 29.5 mbps. Global mobile traffic in 2019 increased by 30.6% compared to 2017, and in the desktop segment it dipped by 3.3%. 70% of searches come from mobile devices, up to 30% of visitors go to sites and leave orders from mobile devices, the average user spends at least 87 hours on performing Internet search activities (Digital Marketing by the Numbers: 2020).

The country with the highest prevalence of smartphones was South Korea – 94% of adults use smartphones and 6% use phones. In second place is Israel with smartphone prevalence of 83%, in third place is Australia with 82%. The United States is in eighth place with 77% (Jomer 2020).

Smartphone sales in the EU and app downloads have increased exponentially over the past years and already over half of Internet access is via mobile devices – and it's still growing. Moreover, most mobile Internet usage is through apps rather than web browsers [11]. The increasing adoption of smartphones and tablets is driving the growing demand for mobile applications. European spending on mobile applications (including user spending and advertising),

totalled €6.1 billion in 2013 and by 2018 – grow to €18.7 billion – so a more than 3-fold increase in just 5 years' time (EU Export Explorer on IT Services 2016).

Android is the leading operating system for mobile devices in Europe. Other mobile operating systems include Apple's iOS (running only on iPads, iPhones and the Apple Watch) and Windows (unlike Google and Apple, Microsoft has only one OS for desktop computers, laptops, tablets and phones). Demand for cross-platform mobile applications is growing (GEN2 Standard 2016).

The market for mobile applications is changing rapidly. New technological trends are emerging continuously, offering new opportunities for mobile applications. As a result of all these developments big data environments are growing fast and are becoming more complex and dynamic, which results in poor usability and reduced control over applications. There is thus an increasing demand for mobile applications that analyze data that is available to companies, or that makes collection and use of this data possible.

European companies prefer to outsource services to providers within the same country (onshoring). When outsourcing to foreign service providers, nearshore locations are preferred to offshore locations, due to their proximity, language and cultural similarities and little or no time difference. Popular nearshore destinations are for example Bulgaria, Poland, Lithuania and Romania. This may be an opportunity for Ukrainian and Moldovan IT Service providers (GEN2 Standard 2016).

Government of the Republic of Moldova approved Strategy for the Development of the Information Technology and Ecosystem Industry for Digital Innovation for 2018-2023. The development of these documents was the base for the growth of IT technologies: the volume of IT services exports in 2011-2016 increased by an average of 10.6% per annum in Moldova, amounting to \$79.2 million in 2016, and the share of such services in the total services exports increased from 5.6% in 2011 to 8.9% in 2016 (IT Sector Strategic Roadmap for Moldova 2020).

The Western Europe with the share of 45% of the total volume dominates the sales markets in the structure of the Moldovan export of IT services, followed by America (USA, Canada) with a 21% share and Central and Eastern Europe with a share of 18%. According to the type of services provided in the ICT sector, 70% of Moldovan companies' exports are IT services, followed by R & D services/ engineering services with a 15% share and BPO services (Business Process Outsourcing) with a 10% share. In turn, 70% of the IT services exports relate to application development and testing, while setting up and supporting applications generates about 14% of these services.

At the same time, it should be noted that large volumes of export of IT services are not reflected in the official external balance sheet, since the work is carried out by freelancers, who working individually in the international companies. Moldova was featured in the Bloomberg Innovation Index and made it into Top 10 Global Innovation Index (GII) economies in mobile App development (Table 1). Apps represent global commerce in completely digital goods, therefore provide insight into how innovation, production, and trade of digitized products and services are evolving in an increasingly globalized digital economy (GII 2020).

Table 1. Top 10 GII economics in mobile creation

Countries	%	Place
Cyprus	100.00	1
Finland	66.11	2
Lithuania	63.35	3
Israel	59.41	4
Estonia	52.44	5
Sweden	50.17	6
Denmark	49.65	7
Korea, Republic of	48.88	8
Moldova, Republic of	45.90	9
Hong Kong (China)	44.50	10

Source: [GII 2020]

Out of 70% of IT services application development and testing services formed 69% of the share, application customization and support 14% (Figure 1). IT services export are focused on web and mobility app development and include focus on languages such as NET, Enterprise Java, C, C++, C#, PHP, Sitecore CMS, iOS, Oracle DB and Cisco networks. Moldova has a relatively high level of Internet penetration. In 2012, Moldova was significantly behind in this indicator and occupied only 37th place in Europe. But in recent years, the country has shown accelerated growth. In 2016, the number of people over 6 years of age using the Internet was 71%, compared with 63% in 2015. In 2017, the number of mobile telephony service users who used 4G mobile Internet via smartphones increased by 45.8%.

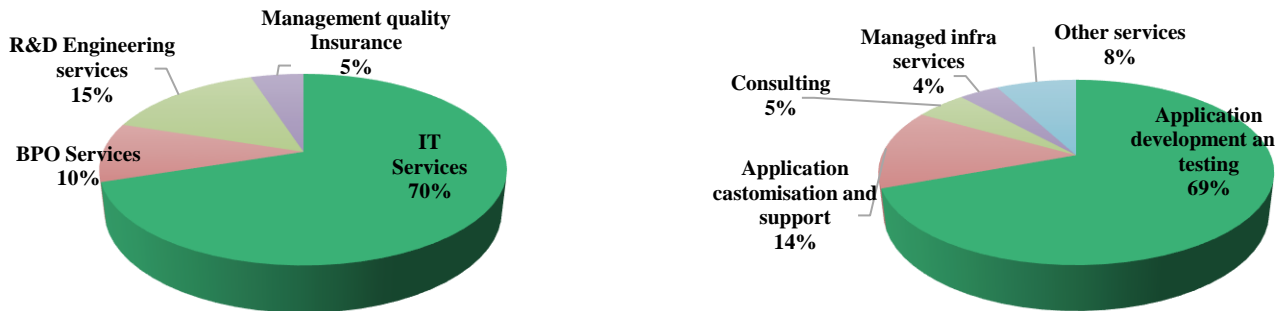

Figure 1. IT services export

Source: [IT Sector Strategic Roadmap for Moldova2020].

The volume of traffic generated by mobile Internet users via smartphones in 2018 increased by 64.2%. As a result of such dynamics, the penetration rate of mobile Internet access services per 100 residents in 2019 increased by 14.3 percentage points and amounted to 82.7%.

Similar global trends are observed in Ukraine. The use of the second and third screens is growing, people are using several mobile devices at the same time. In 2019, the number of Ukrainians in the network amounted to almost 23 million, or 71% of the population, against 63% of the population in 2018. 66% of Ukrainian Internet users use mobile devices. 76.2% of mobile Internet users access the network via Android, 22.5% through Apple devices (Digitalreport2019).

Increasing importance of mobile traffic requires a change in approach to the development of modern web-projects with a focus on improving usability based on the principles of ergonomics and customer-centricity. The issue of web application development, adapted for use with mobile devices, is critical in digital marketing. Mobile versions have a number of features that must be considered to ensure high usability. Ergonomics means fitness for use, availability of conditions and pre-conditions for easy, enjoyable, non-burdening use.

Improper model selection causes the site to lose a large share of the market. To provide the most user-friendly interface and navigation, an adequate choice of technology is required at the stage of designing the structure of the web-resource and program code. When choosing a technology, consider the limitations of content minimalism requirements, the complexity of the project, the type of device screens, mono- or multi-variant versions of web-projects, the type of operating system that will be applied.

Mobile marketing IT project management methodologies can be divided into traditional and flexible (iterative). Traditional – based on fairly strict planning of the project before launch and minimal interventions after. With this approach, each subsequent phase begins after the completion of the previous one. The traditional approach correlates with the classic project management standard from PMI – PMBOK (PMBOK 2018). Agile Agencies are more effective in a rapidly changing business environment. Agile methodologies encourage change at all stages. This makes them more competitive in current realities. The use of flexible methodologies in the management of IT projects for mobile marketing increases the manageability of the project and allows you to get an effective return on investment; provide structure flexibility.

Agile methodologies are based on adaptive development, focusing on people and their interaction, rather than on processes and tools. They are characterized by flexibility, iterativeness, adaptability. Conducive to breaking into small manageable work packages. An iterative and incremental approach to project and product management, focused on the dynamic formation of requirements and ensuring their implementation as a result of constant interaction within self-organizing working groups consisting of specialists of various profiles. A working product is more important than comprehensive documentation; cooperation with the customer is more important than agreement on the terms of the contract; readiness for change is more important than following the original plan. Suitable for open end projects.

The share of Agile projects in the total array is steadily increasing (from 9% in 2010 to 25% in 2019), while traditional approaches are losing popularity, which is particularly noticeable in application development (COBB 2016:115). Among the methods based on the ideas of Agile, the most popular are Scrum and Kanban.

Kanban (Toyota, 1953) a development management method that implements the principle on time and contributes to an even distribution of workload between employees. The product increment is passed forward from stage to stage, and at the end, an element ready for delivery is obtained. Accurate calculation of the load on the team, the correct placement of constraints and focus on continuous improvement. The main task of Kanban is to reduce the amount of “work currently in progress”. In Kanban, estimates of the deadlines for the task are optional or none at all. Kanban is a tool for visualizing the process and limiting the execution of the simultaneous number of tasks, but it alone is not enough for a successful project. Suitable for fairly cohesive teams with good communication.

Scrum is the most structured of the Agile family, combines the elements of the classical process and the ideas of a flexible approach to project management. Scrum is a set of principles on which the development process is built, which allows to provide a product to a customer in hard-fixed and short-term iterations, called sprints. The scrum methodology is aimed at interacting with the customer, and despite the fact that the development team decides what tasks it will perform during one iteration, there is a leader (scrum master) in this methodology who monitors the process. Using this methodology makes it possible to identify and eliminate deviations from the desired result at earlier stages of software product development.

Table 2 shows a comparative analysis of the features and areas of applicability of flexible methodologies for managing mobile marketing IT projects.

Table 2. Analysis of the application of IT project management methods in the company

Method	Features	Usage in projects
Micro-management	Problems regarding involving the team in the development process; internal security threat (project, information, staff).	The number of people in the project does not exceed 10. Leadership lacks delegation skills or is reluctant to delegate.
Kanban boards	Just in time (JIT) principle. Helps to identify bottlenecks in the project. A visual solution that involves prioritizing. Panoramic view of the project. Provides business opportunity to be reactive to customer needs. It's hard to combine testing and development in one team.	Task-oriented. High volume of tasks. The requirements are constantly changing. Many tasks may be out of date and get “demoted”.
Scrum	Aims for interaction with the customer. More communications. The beginning of the sprint is accompanied by planning: analysis and evaluation of tasks. Weekly mandatory stand-ups. After the sprint, a retrospective is held. As a result, all communications (meetings, workshop, sprint retrospective, etc.) take about 30% of the time.	Team-oriented. Projects with flexible workflow algorithm, uncertainties, variable requirements, inability to determine the time limits of tasks in advance. Quick launch of the project with the most priority functions.

Source: *Elaborated by the authors.*

When using flexible methodologies in mobile marketing IT projects, it is necessary to take into account a number of critical problems associated with determining the target market, designing, prototyping, organizing teamwork, and choosing the MVP functionality (minimum viable product). Underestimating the importance of these issues leads to the fact that only 29 out of 100 IT mobile marketing projects reach the stage of successful implementation (Chaikovska, Chaykovskyy 2018:68). To evaluate the applicability of Kanban and Scrum, a mobile marketing IT project was modeled. Despite the fact that the baseline duration of a project modeled using the Scrum methodology is the same as the duration of a project implemented using Kanban, the variance in both the duration and cost of a project modeled using the Scrum methodology is much less than in Kanban with an obvious gain in product quality.

**Table 3. Comparison of Scrum and Kanban by criteria**

Criteria	Scrum	Kanban
Evaluation of terms	+	-
Long-term planning	+	-
Roles	+	-
Changes after scheduling	-	+
Technical task	+	-
Quick reaction	-	+
Narrow specialization in the team	+	-
Daily meetings	+	+
The division of tasks into several stages	+	-

*Source: Elaborated by the authors using COBB G (2016).*

The basis of flexible IT project management methodologies is a retrospective. However, there are various approaches to conducting a retrospective, to choosing a model and an algorithm for its implementation. According to the cascade model, a retrospective should be carried out in the late stages of an IT project. An alternative approach recommended in benchmarking is the continuous retrospective of an IT project. The main feature of this approach is the departure from a phased model to a spiral one, with daily milestones (“stand-up” assemblies) (Chaikovska:57). Continuous retrospective is implemented by the following activities: visualization of the problem, development of a business process model for its implementation, analysis of alternative options for its operational resolution.

### CONCLUSIONS AND PROSPECTS FOR FURTHER DEVELOPMENTS

Mobile marketing is constantly evolving. In a world where people read their correspondence, socialize and search for different information through mobile devices, businesses need new marketing strategies and tools, new approaches to managing. Applying these flexible approaches will encourage customers using mobile services to visit the site. It will contribute to creating applications that provide unique usability content, and among other things, digital presence.

One of the main tasks that directly affect the effectiveness of software development is choosing a model for the development process. There is no single optimal choice. The model may vary depending on the scale, novelty and criticality of the project, distribution of participants, customer requirements. Today, the traditional approach to managing IT projects is having considerable difficulties when project requirements can change at almost any stage, as it is necessary to respond to the rapidly changing environment.

These are exactly the challenges inherent to mobile marketing IT projects. Flexible methodologies have their own challenges. It is important to perceive them as “challenges” and not advantages or disadvantages. Micromanagement and Kanban are good for small business website projects that don't take much time to plan. Scrum is suitable for a large project (3 months in duration) that has full specification and requirements before development begins.

In this case, the team can easily draw up a detailed development plan and split the whole process into a sprint. Implementing Scrum and switching to flexible methodologies takes time and

effort. Flexible team goes through the stages of formation, conflict, normalization, and cooperation. Productive work is only possible at the last stage, at which point the manager needs to help and support the team.

The transition to flexible methodologies involves a dramatic change in the tasks and methods of executives' work. The leadership style of the manager should focus on delegation, virtually all authority is transferred to the team, and the task of the manager is to teach them to act independently, to organize and support the work process.

The underlying complexity of using flexible methodologies is that it is not just a change in the work process, it is also a change of mindset: working together to achieve a goal that determines the direction of further research. These recommendations will have a practical approach for IT companies of the Republic of Moldova and Ukraine.

## RISCURILE DE SECURITATE A INSTRUMENTULUI DE SEMNARE ELECTRONICĂ ȘI DE IDENTIFICARE ÎN SISTEMELE INFORMAȚIONALE

### SECURITY RISKS OF THE ELECTRONIC SIGNING INSTRUMENT AND IDENTIFICATION IN INFORMATION SYSTEMS

**Chirtoacă Mariana**

Doctorandă ASEM

[mariana.chirtoaca@inbox.ru](mailto:mariana.chirtoaca@inbox.ru)

**Rezumat.** Sistemele informaționale de stat, prin intermediul cărora autoritățile/instituțiile publice prestează diverse servicii, impun în mod direct deținerea instrumentului de identificare a persoanei în lumea virtuală și de semnare electronică a documentelor întocmite în cadrul acestora. Pornind de la necesitatea obținerii semnăturii electronice pentru utilizarea serviciilor electronice de către mediul de afaceri, dar și de către persoanele fizice, cetățenii Republicii Moldova devin titulari ai unui instrument care deschide porțile de acces către o multitudine de date personale și confidențiale ale persoanei juridice și de semnare, practic, a oricărui tip de document în calitatea sa de persoană fizică sau persoană juridică. Riscurile la care se supun titularii semnăturii electronice în utilizarea neconformă a instrumentului de semnare reprezintă un subiect care ar depăși cu mult materialul respectiv și ar presupune un plan de acțiuni din partea autorităților publice pentru minimizarea acestora.

**Cuvinte cheie:** Semnătură electronică, certificat al cheii publice și private, sisteme informaționale, administrator, conducător, persoană juridică, persoană fizică.

**Abstract.** State information systems, through which public authorities/institutions provide various services, directly require the possession of the tool to identify the person in the virtual world and to electronically sign the documents prepared within them. Starting from the need to obtain the electronic signature for the use of electronic services by the business environment, but also by individuals, the citizens of the Republic of Moldova become holders of an instrument that opens the doors to access a multitude of personal and confidential data of the legal entity and to sign, practically, any type of document in its capacity as a natural or legal person. The risks to the holders of electronic signatures in the improper use of the signature tool are a subject that would go far beyond the material in question and would require a plan of action by public authorities to minimize them.

**Key words:** Electronic signature, public and private key certificate, information systems, administrator, manager, legal entity, citizen.

**Introducere.** Circulația documentelor electronice în Republica Moldova a avansat semnificativ în ultimii ani, în special începând cu perioada de restricții impuse pentru protecția
